General Informations

- Improved on time performance
- Optimised use infrastructures and of available resources
- Improved horizon time predictability for all the productive processes.
- Reduced around movements costs;
- Optimised predeparture sequence.

Elements and operational units of A-CDM

Variable Taxi Time Calculation

Pre-departure sequences

Establishes an off-block sequence taking into account operator's preferences and operational constraints.

Is the key to predictability of accurate takeoff and in block times.

Aircraft Operators

Information Sharing

Is the foundation for all the other A-CDM elements

The Milestones Approach

Aims to achieve common situational awareness by tracking the progress of a flight from initial planning to take-off

CFMU

Enhances the quality of arrival and departure information exchanges between the CFMU and the CDM airports.

CDM in adverse conditions

Achieves collaborative management of the airport during periods of predicted or unpredicted reductions of capacity (e.g. winter operation)
